DETAILED ACTION***Claim Objections***

Claims 1-12 are objected to because of the following informalities: Throughout the claims, applicant introduces signals from output or control terminals as "the signal" although a signal was not previously introduced. While it is fair to assume that a signal will appear at an output terminal, it would avoid confusion to introduce such signals as "a signal" instead. As an example, please consider claim 1, lines 21 and 22 wherein "the signal of the first-stage output terminal" should instead be "a signal of the first-stage output terminal". Applicant is required to correct occurrences of similar language in the claims. In claims 6, "logic gate" should be in its plural form. Appropriate correction is required.

Claim Rejections - 35 USC § 112

The following is a quotation of the first paragraph of 35 U.S.C. 112:

The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his invention.

Claims 4 and 7-12 are rejected under 35 U.S.C. 112, first paragraph, as failing to comply with the enablement requirement. The claim(s) contains subject matter which was not described in the specification in such a way as to enable one skilled in the art to which it pertains, or with which it is most nearly connected, to make and/or use the invention. Initially, it should be noted that the specification largely relies on language that largely duplicates the language in the claims defining structural relationships without explaining the present inventions operation. In most instances that is sufficient;

Art Unit: 2816

however, the specification does not adequately describe second and third control circuits receiving clock signals as inputs as recited in claims 4 and 10 or an embodiment such as described in the last paragraph of claim 7 wherein the shift register units receive clock signals at input terminals other than clock input terminals. It also appears as if applicant inadvertently recited the "second bi-directional control circuit" in claim 4 when the "third bi-directional control circuit" consistent with claim 10 was intended but, in any event, the specification does not adequately describe such an arrangement. In these instances wherein an adequate description was not included, one of ordinary skill in the art would not be able to make and/or use the present invention.

Allowable Subject Matter

Claims 1-3, 5 and 6 are allowed.

Claim 7 would be allowable if rewritten or amended to overcome the rejection(s) under 35 U.S.C. 112, second paragraph, set forth in this Office action.

Claims 4 and 8-12 would be allowable if rewritten to overcome the rejection(s) under 35 U.S.C. 112, second paragraph, set forth in this Office action and to include all of the limitations of the base claim and any intervening claims.

Conclusion

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Fujisawa is relevant to the present invention in that it teaches level shifting in a bi-directional shift register.
